

# Week 1 Memo

**To:** Senior Manager

This memo explains the operations tracking tool created in Week 1. The purpose of the tool is to measure how efficiently each operational site performs by comparing its actual output with its planned target. Instead of staff calculating percentages by hand, the tool performs the same checks automatically every time new figures are available. This creates a consistent process and reduces the chance of human error.

Automating efficiency tracking is important because operational performance can change quickly. Manual checks often take time, especially when multiple sites must be reviewed. Delays mean that problems such as reduced productivity or missed targets may not be noticed until they have already affected costs or customer service. By automatically reviewing every site's results, managers receive immediate feedback about which locations are performing well and which require attention.

The tool also assigns each site a simple performance label: Critical, Warning, or Normal. These labels make the results easy to understand without needing detailed calculations. A manager can immediately identify underperforming sites, focus investigations where they are most needed, and prioritize corrective action. This is much faster than reading through spreadsheets and manually comparing values.

For deployment, I recommend introducing this tool within the Operations Department as part of the daily or weekly reporting process. Staff would enter the latest production figures, and the tool would automatically generate an easy-to-read summary for each site. Over time, it could be connected to existing reporting systems so managers receive regular performance updates and can respond to operational issues sooner. Overall, this approach supports faster decision-making, improves consistency, and helps maintain operational standards across all sites.
